

Enhanced Entity-Relationship Diagram(EERD)

Assumptions:

In our Entity Relationship diagram, the 'Bookings' entity is common for flight bookings as well as property bookings. The attribute 'type' corresponds to type of the booking (flight/property). It is a weak entity as it does not have a unique identifier. One customer can have multiple bookings (properties or flights) but one booking can only be between one customer and one property or between one customer and one flight.

In the rate relationship between clients, we assume that customers can rate owners and owners can rate customers but there is no provision for a customer to rate another customer or owners to rate owners. The exception to this is if an individual is both a customer and an owner.
